**LAB REPORT**  
**on**

## **COMPUTER NETWORKS** **20CS5PCCON**

*Submitted by*

**VINAYAK Y BAJANTRI (1BM20CS189)**

*in partial fulfillment for the award of the degree of*  
**BACHELOR OF ENGINEERING**  
*in*  
**COMPUTER SCIENCE AND ENGINEERING**

**B.M.S. COLLEGE OF ENGINEERING**

(Autonomous Institution under VTU)

**BENGALURU-560019**

**October-2022 to Feb-2023**

**B. M. S. College of Engineering,**

**Bull Temple Road, Bangalore 560019**

(Affiliated To Visvesvaraya Technological University, Belgaum)

**Department of Computer Science and Engineering**

### **CERTIFICATE**

This is to certify that the Lab work entitled “LAB COURSE **COMPUTER NETWORKS** ” is **carried** out by **VINAYAK Y BAJANTRI (1BM20CS189)**, who is a bonafide student of **B. M. S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum during the year 2022. The Lab report has been approved as it satisfies the academic requirements in respect of a **Computer Networks - (20CS5PCCON)** work prescribed for the said degree.

**Nandhini Vineeth Dr. Jyothi S Nayak** Assistant Professor Professor and Head Department of CSE  
Department of CSE BMSCE, Bengaluru BMSCE, Bengaluru

## Cycle-1

### Experiment No-1

**Aim:** Creating a topology and simulating sending a simple PDU from source to destination using hub and switch as connecting devices.

#### 1. PC and Hub

and Switch

#### 2. Pc

#### 3. PCs with combination of Switch and Hub

**Procedure:**

- Put all the devices(PCs, Hubs and Switches) needed for the experiment on the screen by looking at the topology.
- Choose the correct wire and do the Connection as shown in the topology
- Give ip address to all the devices
- Ping from one pc to all other pc in the network to make sure that the connection is correct.

**Output:**

```
PC>ping 20.0.0.1
```

```
Pinging 20.0.0.1 with 32 bytes of data:
```

```
Request timed out.
```

```
Reply from 20.0.0.1: bytes=32 time=0ms TTL=127
```

```
Reply from 20.0.0.1: bytes=32 time=0ms TTL=127
```

```
Reply from 20.0.0.1: bytes=32 time=0ms TTL=127
```

```
Ping statistics for 20.0.0.1:
```

```
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
```

```
Approximate round trip times in milli-seconds:
```

```
    Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

```
PC>ping 20.0.0.1
```

```
Pinging 20.0.0.1 with 32 bytes of data:
```

```
Reply from 20.0.0.1: bytes=32 time=0ms TTL=127
```

```
Reply from 20.0.0.1: bytes=32 time=4ms TTL=127
```

```
Reply from 20.0.0.1: bytes=32 time=1ms TTL=127
```

```
Reply from 20.0.0.1: bytes=32 time=0ms TTL=127
```

```
Ping statistics for 20.0.0.1:
```

```
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
```

```
Approximate round trip times in milli-seconds:
```

```
    Minimum = 0ms, Maximum = 4ms, Average = 1ms
```

# Experiment No-2

**Aim:**Configuring IP address to Routers in Packet Tracer. Explore the following messages: Ping Responses, Destination unreachable, Request timed out, Reply

## Topology:

## Procedure:

1. connect PC-0 with Router-0 using copper cross-over cable - fastethernet0/0
2. connect Router-0 to Router-1 using Serial DCE with the connection named as serial2/0, then connect Router1 to Router2 using serial DCE named serial3/0
3. connect Router2 to PC1 using copper cross-over cable - fastethernet1/0
4. set the IP addresses, subnet mask (255.0.0.0 for all PCs and routers) and gateways accordingly.

- a. PC0: IP address = 10.0.0.1 gateway = 10.0.0.10
- b. Router0: gateway1 = 10.0.0.10 gateway2 = 20.0.0.10
- c. Router1: gateway1 = 20.0.0.20 gateway2 = 30.0.0.10
- d. Router2: gateway1 = 30.0.0.20 gateway2 = 40.0.0.10
- e. PC1: IP address = 40.0.0.1 gateway = 40.0.0.10

5. for the Router0, the first gateway is set to IP address of 10.0.0.10 which is as same as gateway of PC0 then set up the connection between the

i. Router0 and the PC0 using the CLI.

ii. Router0 and Router1

iii. Router1 and Router2

iv. Router2 and PC1 using CLI

**Do (config-if)#ip route {destination-network} {mask} {next-hop-address} for all the routers**

## Output:

Packet Tracer PC Command Line 1.0

PC>ping 10.0.0.10

Pinging 10.0.0.10 with 32 bytes of data:

Reply from 10.0.0.10: bytes=32 time=1ms TTL=255

Reply from 10.0.0.10: bytes=32 time=0ms TTL=255

Reply from 10.0.0.10: bytes=32 time=0ms TTL=255

Reply from 10.0.0.10: bytes=32 time=0ms TTL=255

Ping statistics for 10.0.0.10:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milli-seconds:

Minimum = 0ms, Maximum = 1ms, Average = 0ms

# Experiment No-3

**Aim:**Configuring default route to the Router.

## Topology:

## Procedure:

- Do the connections as shown in the topology diagram.
- Assign an ip address to all the PCs.
- For router to router configuration do:
  - **(config)#ip route 0.0.0.0 0.0.0.0 {Next-hop-Address}**

## Output:

```
PC>ping 10.0.0.10
```

```
Pinging 10.0.0.10 with 32 bytes of data:
```

```
Reply from 10.0.0.10: bytes=32 time=50ms TTL=255
```

```
Reply from 10.0.0.10: bytes=32 time=0ms TTL=255
```

```
Reply from 10.0.0.10: bytes=32 time=0ms TTL=255
```

```
Reply from 10.0.0.10: bytes=32 time=0ms TTL=255
```

```
Ping statistics for 10.0.0.10:
```

```
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
```

```
Approximate round trip times in milli-seconds:
```

```
Minimum = 0ms, Maximum = 50ms, Average = 12ms
```

## Experiment No-4

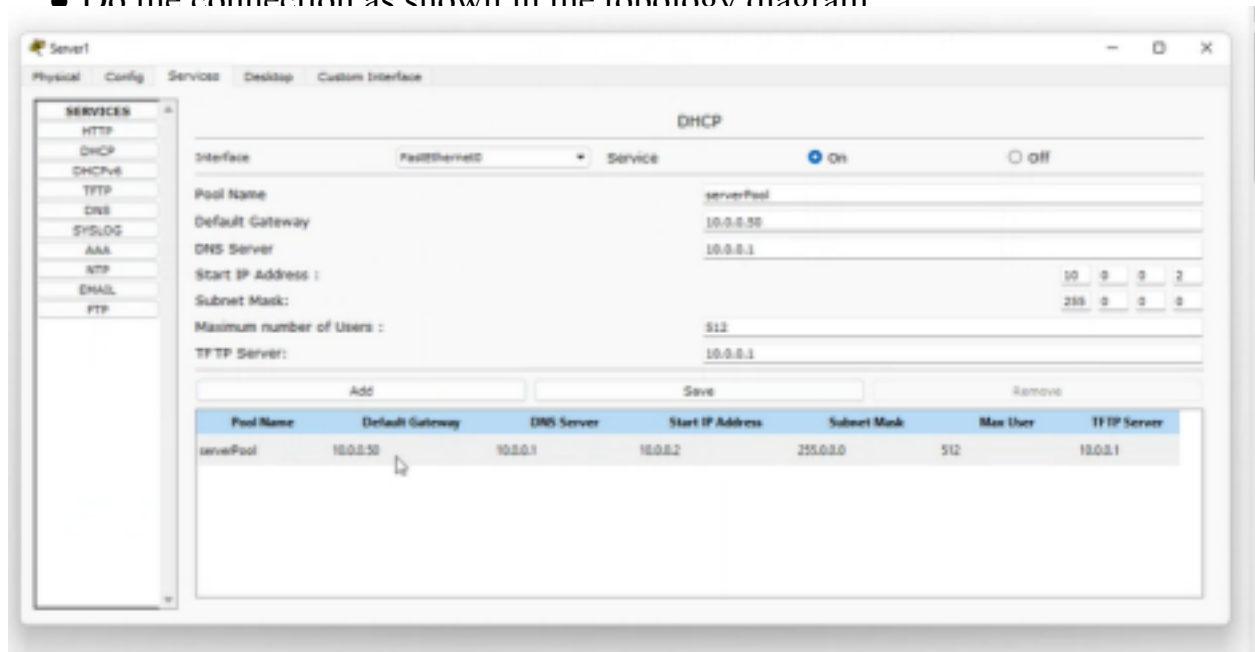

**Aim:**Configuring DHCP within a LAN in a packet Tracer

## Topology:

## Procedure:

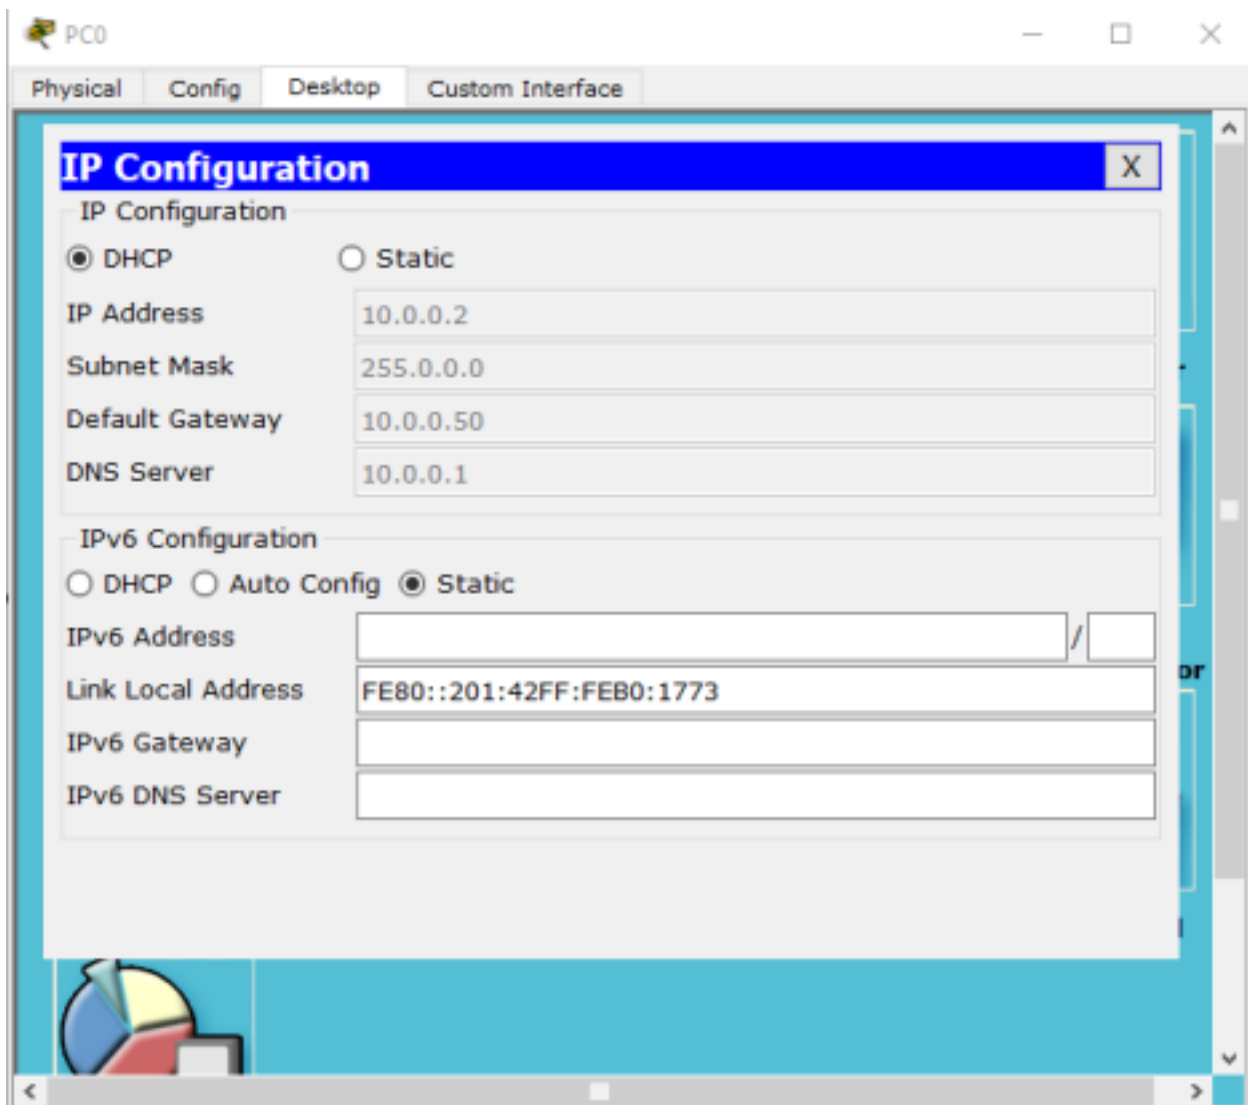

- Do the connection as shown in the topology diagram

- For DHCP settings go to server and do the following

- For the PCs Go to ip configuration>Select DHCP.

=

## Output:

Packet Tracer PC Command Line 1.0

```
PC>ping 10.0.0.4
```

Pinging 10.0.0.4 with 32 bytes of data:

Reply from 10.0.0.4: bytes=32 time=0ms TTL=128

Reply from 10.0.0.4: bytes=32 time=0ms TTL=128

Reply from 10.0.0.4: bytes=32 time=0ms TTL=128

Reply from 10.0.0.4: bytes=32 time=0ms TTL=128

Ping statistics for 10.0.0.4:

Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),

Approximate round trip times in milli-seconds: Minimum =

0ms, Maximum = 0ms, Average = 0ms

# Experiment No-5

**Aim:**Configuring RIP Routing Protocol in Routers.

**Topology:**

**Procedure:**

Router enable Router#config t

Router (config)#interface fastethernet0/0

Router (config-if)# ip address 10.0.0.10 255.0.0.0

Router (config-if)#no shut

Router (config-if)#exit

Router (config)#interface serial2/0

Router (config-if)#ip address 20.0.0.10 255.0.0.0

Router (config-if)#encapsulation ppp

Router (config-if)#clock rate 6400 Unknown clock rate

Router (config-if)#clock rate 64000

Router (config-if)#no shut

Router (config) #interface serial2/0 Router

(config-if)#ip address 20.0.0.20 255.0.0.0

Router (config-if)#encapsulation ppp

Router (config-if)#no shut

Router (config) #interface serial 3/0

Router (config-if)# ip address 30.0.0.10 255.0.0.0

Router (config-if)#encapsulation ppp

Router (config-if)#clock rate 64000 Router (config-if)#no shut

## Output:

Packet Tracer PC Command Line 1.0

PC>ping 40.0.0.1

Pinging 40.0.0.1 with 32 bytes of data:

Request timed out.

Reply from 40.0.0.1: bytes=32 time=12ms TTL=125

Reply from 40.0.0.1: bytes=32 time=6ms TTL=125

Reply from 40.0.0.1: bytes=32 time=14ms TTL=125

Ping statistics for 40.0.0.1:

Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),

Approximate round trip times in milli-seconds: Minimum =

6ms, Maximum = 14ms, Average = 10ms

# Experiment No-6

**Aim**• Demonstration of WEB server and DNS using Packet Tracer

## Topology:

## Procedure:

- set up IP address for PC0 and server
- select PC, choose Desktop tab, choose Web Browser and enter 10.0.0.10 IP address, which displays the home page
- select server, choose Services tab, select HTTP and switch it on. Click the edit button for index.html and edit the file.
- switch the DNS on, and add a domain name - bmsce with the address 10.0.0.10
- search for the domain name in the web browser of the PC.

## Output:

## CYCLE - 2

**Program 1 : Write a program for error detecting code using CRC-CCITT (16-bits).**

**Code :**

```
#include <iostream>
#include <string.h>
using namespace std;
int crc(char *ip, char *op, char *poly, int mode)
{
    strcpy(op, ip);
    if (mode) {
        for (int i = 1; i < strlen(poly); i++)
            strcat(op, "0");
    }
    /* Perform XOR on the msg with the selected polynomial */
    for (int i = 0; i < strlen(ip); i++) {
        if (op[i] == '1') {
            for (int j = 0; j < strlen(poly); j++) {
                if (op[i + j] == poly[j])
                    op[i + j] = '0';
                else
                    op[i + j] = '1';
            }
        }
    }
    /* check for errors. return 0 if error detected */
    for (int i = 0; i < strlen(op); i++)
        if (op[i] == '1')
            return 0;

    return 1;
}

int main(){
    char ip[50], op[50], recv[50];

    char poly[] = "100010000000100001";
    cout << "Enter the input message in binary" << endl;
    cin >> ip;
    crc(ip, op, poly, 1);
    cout << "The transmitted message is: " << ip << op + strlen(ip) <<
    endl; cout << "Enter the received message in binary" << endl;
    cin >> recv;
```

```
if (crc(recv, op, poly, 0))  
    cout << "No error in data" << endl;  
else  
    cout << "Error in data transmission has occurred" << endl;  
  
return 0;  
}
```

### Output :

```
/tmp/k1PKSgKXwt.o  
Enter the input message in binary  
11100011100100000  
The transmitted message is: 111000111001000001001110010010001  
Enter the received message in binary  
111000111001000001001110010010001  
No error in data  
|
```

## Program 2 : Write a program for distance vector algorithm to find suitable path for transmission

### Code :

```
class Topology:
    def __init__(self, array_of_points):
        self.nodes = array_of_points
        self.edges = []

    def add_direct_connection(self, p1, p2, cost):
        self.edges.append((p1, p2, cost))
        self.edges.append((p2, p1, cost))

    def distance_vector_routing(self):
        import collections
        for node in self.nodes:
            dist = collections.defaultdict(int)
            next_hop = {node: node}
            for other_node in self.nodes:
                if other_node != node:
                    dist[other_node] = 1000000000 # infinity
            # Bellman Ford Algorithm
            for i in range(len(self.nodes)-1):
                for edge in self.edges:
                    src, dest, cost = edge
                    if dist[src] + cost < dist[dest]:
                        dist[dest] = dist[src] + cost
                        if src == node:
